

UNLOCK DATA FROM
ANY MACHINE, ANYWHERE

The background of the lower half of the page is a dark blue digital landscape. It features several overlapping data visualizations: a prominent multi-colored line graph (purple, blue, red, yellow) on the left, a candlestick chart in the center, and a bar chart at the bottom. A network of white lines and dots is visible on the right side, suggesting a data network or cloud infrastructure. A large, solid orange triangle is positioned on the right side, partially overlapping the data visualizations.

MACHINE DATA
GATEWAY

rct-global.com

RCT's Machine Data Gateway (MDG) is a unique, state-of-the-art device that unlocks, gathers and collates a broad range of data to a singular cloud-based data lake. Businesses from any industry worldwide can significantly optimise their

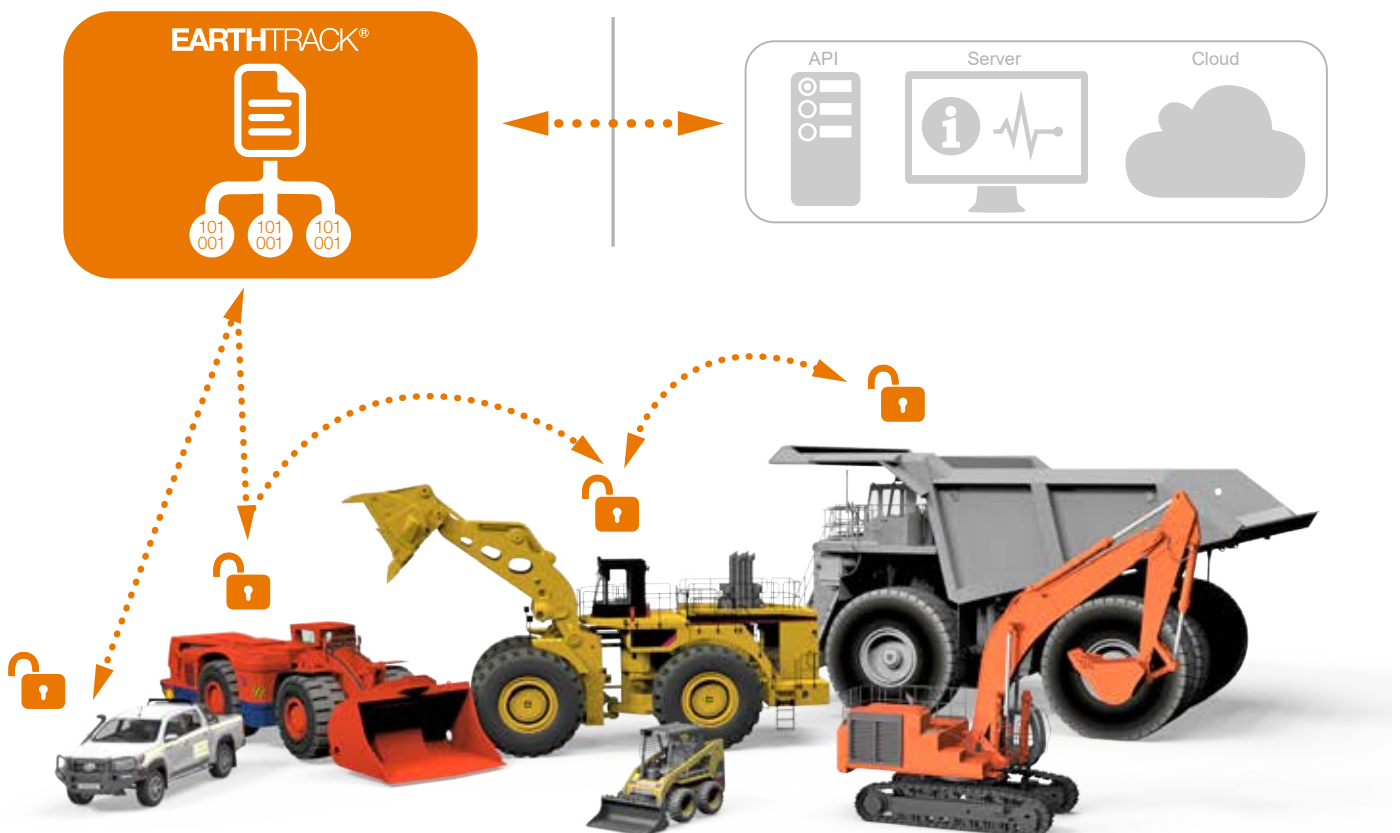

operations as the MDG will unify access to all forms of raw data being produced by the fleet. The raw data can be collected across all machines such as trucks, loaders, rock breakers and light vehicles – regardless of age, make or model.

COLLECTION & PREPARATION OF DATA FOR YOUR BUSINESS ANALYTICS SOFTWARE

Collating all the data from multiple sources to a single location, RCT can harness and deliver this raw data in several ways such as site server and API. The useful raw data retrieved and prepared by the MDG is the all-important first step in the data processing

cycle. Operations can then leverage and access the data lake by uploading to its own business analytics software to transform into actionable insights and explore opportunities across all aspects of the machine operation.

ANY NETWORK

The MDG creates its own meshed network, meaning it is ideal for applications where network communications between machines and cloud services are fragmented. This means vital information is not missed at times where communications drop out on site. It is also equally suited to applications with more permanent network infrastructure in order to safeguard the retainment of important information for business analytics. As the MDG collects, stores and transfers data between each piece of equipment, this minimises the need to install expensive communications infrastructures.

NO OEM RESTRICTIONS

Original Equipment Manufacturers (OEM) can ultimately decide what data customers are provided, whereas the MDG unlocks and provides full unrestricted access to data. No matter what brand of machine fleet or third-party system your operation has, data is delivered in a consolidated format, facilitating a big picture view of how your operation is running to forecast and pinpoint bottlenecks.
